

CRCM5

Katja Winger
Centre ESCER, Université du Québec à Montréal

UQÀM

Model: **CRCM5** a.k.a. **GEMCLIM**

- 5th generation of the Canadian Regional Climate Model at UQAM
 - based on **GEM** (**G**eneral **E**nvironmental **M**ultiscale), Environment Canada's numerical weather prediction model
 - Dynamics **GEM_3.3.3** & **Physics_5.0.4** +
 - Development at Centre ESCER primarily funded by CFCAS & Ouranos
-
- operates on massively parallelised computer architecture (such as CLUMEQ)
 - supports a number of model configurations within a single system

Global uniform

Limited area

Global variable

Outline

Rotated grids

Geophysical fields

Model grid “zones”

Model input / Driving data

Model output

Simulations

Aggregation

One grid cell => up to 5 different surface types:

- 1: Soil / Land
- 2: Glaciers
- 3: Water / Ocean
- 4: Marine ice
- 5: **Aggregated value**
- 6: Lakes

Surface fraction

land-sea
mask

lakes

salt water

glaciers &
ice sheets

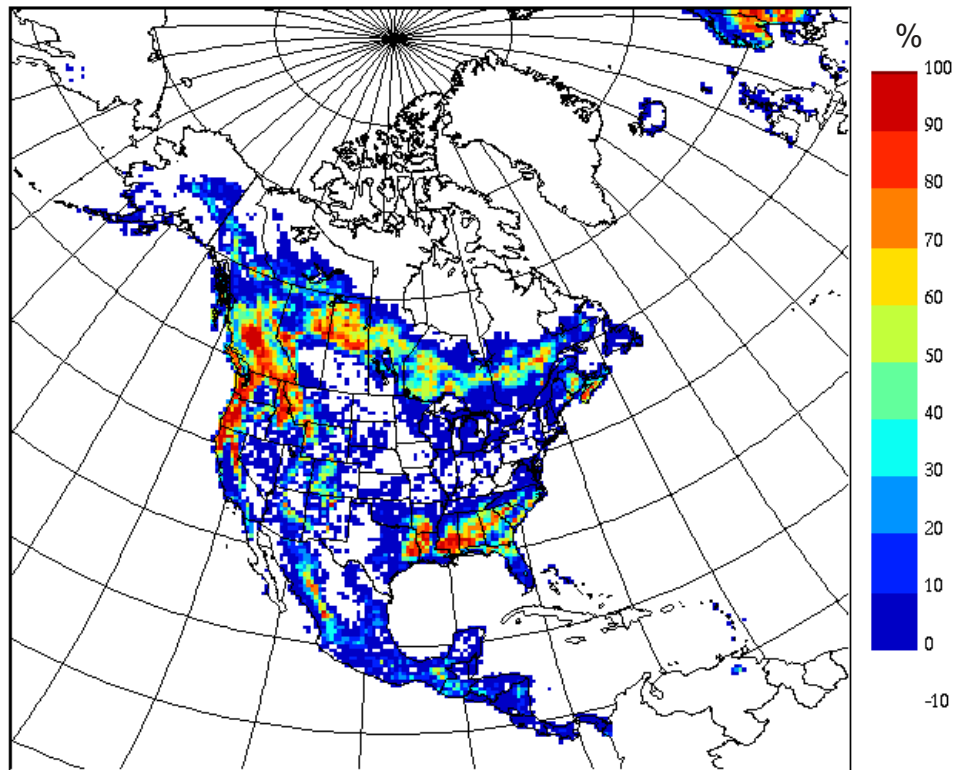

Vegetation fractions

The “Land” surface fraction gets constructed from 23 vegetation fractions

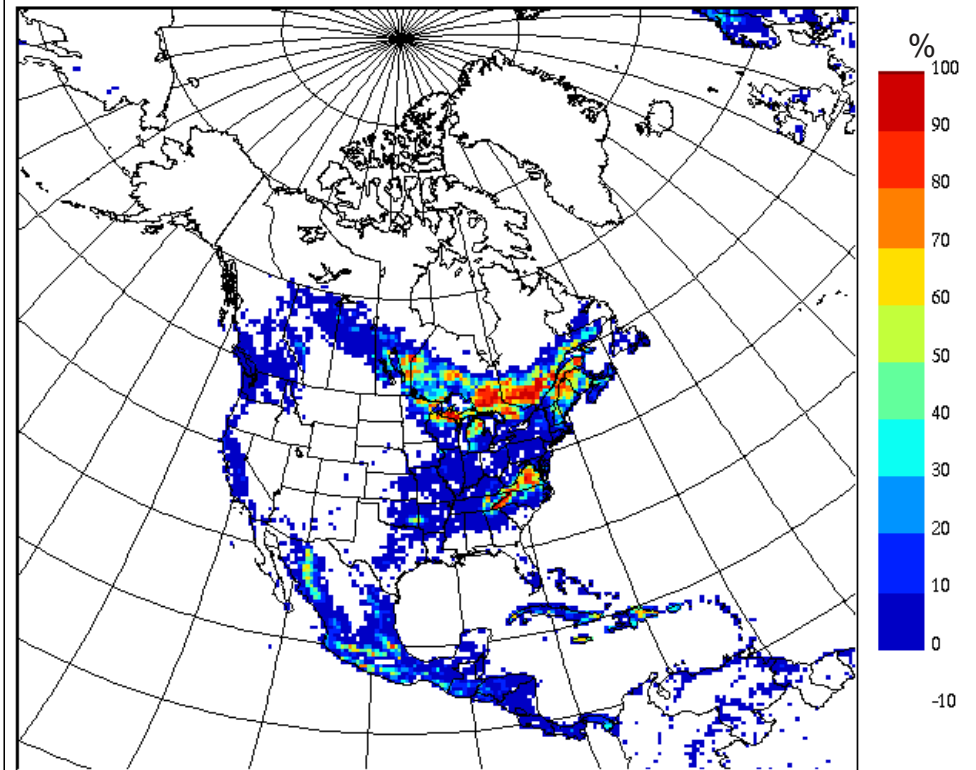

Needleleafs

evergreen needleleaf trees

mixed wood forest 50%

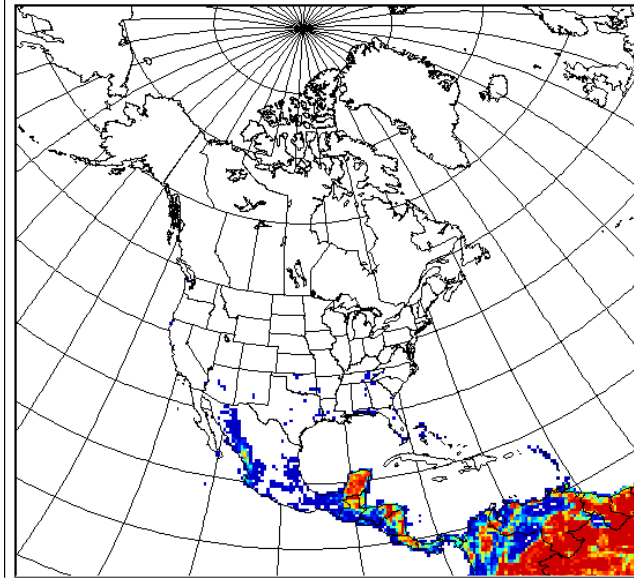

Broadleaves

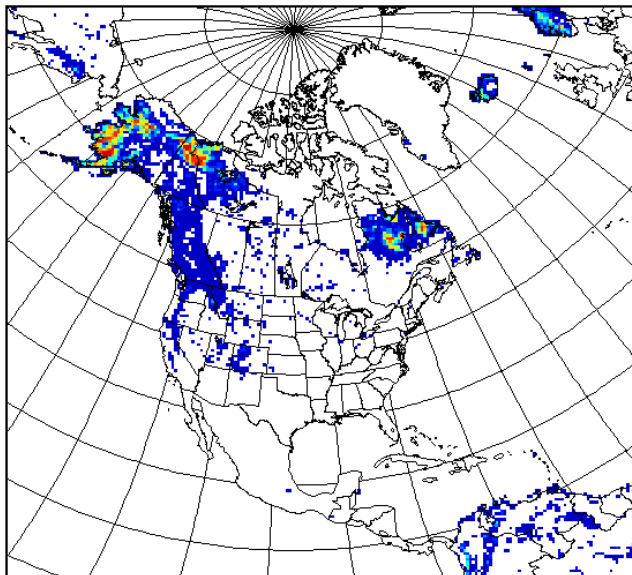

deciduous broadleaf

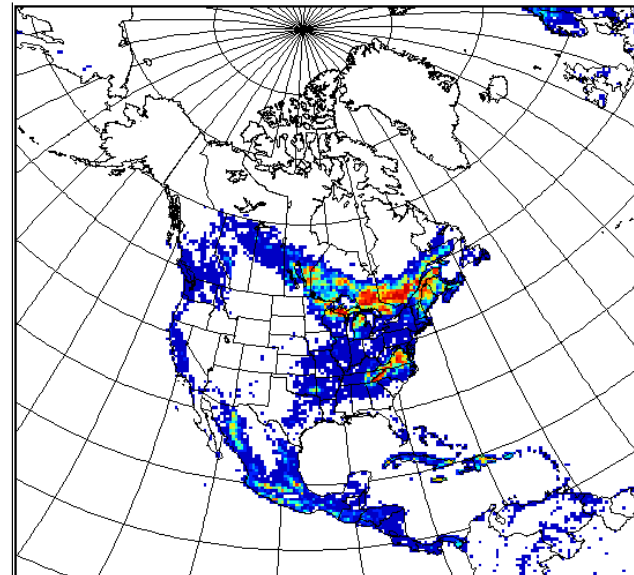

evergreen broadleaf trees

deciduous shrubs

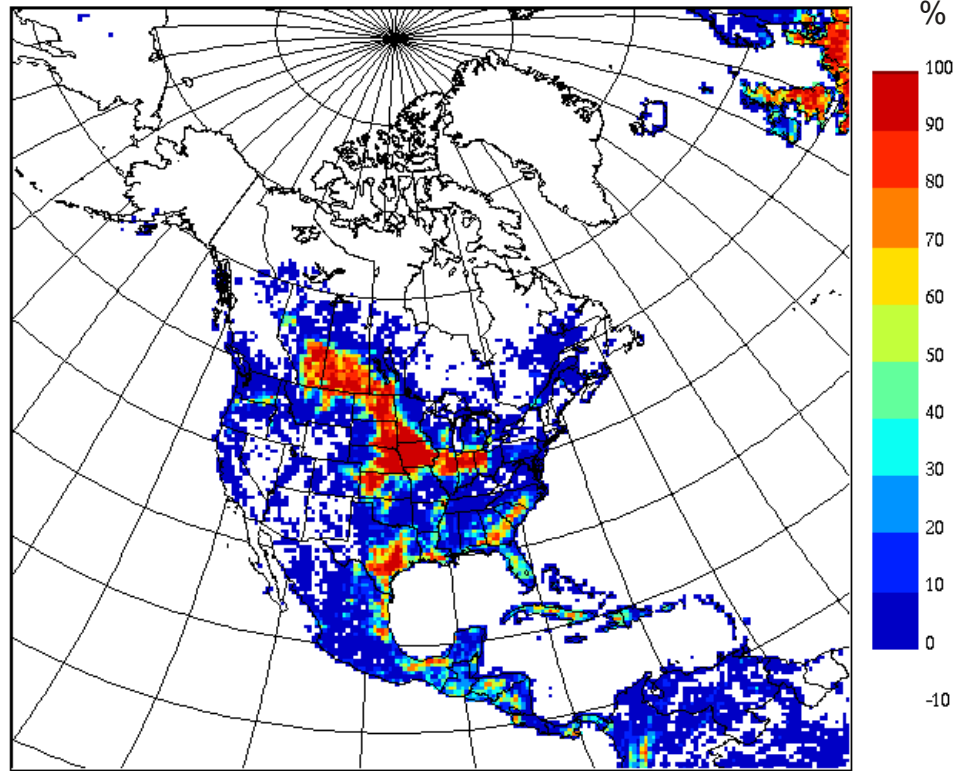

50% of
mixed wood forest

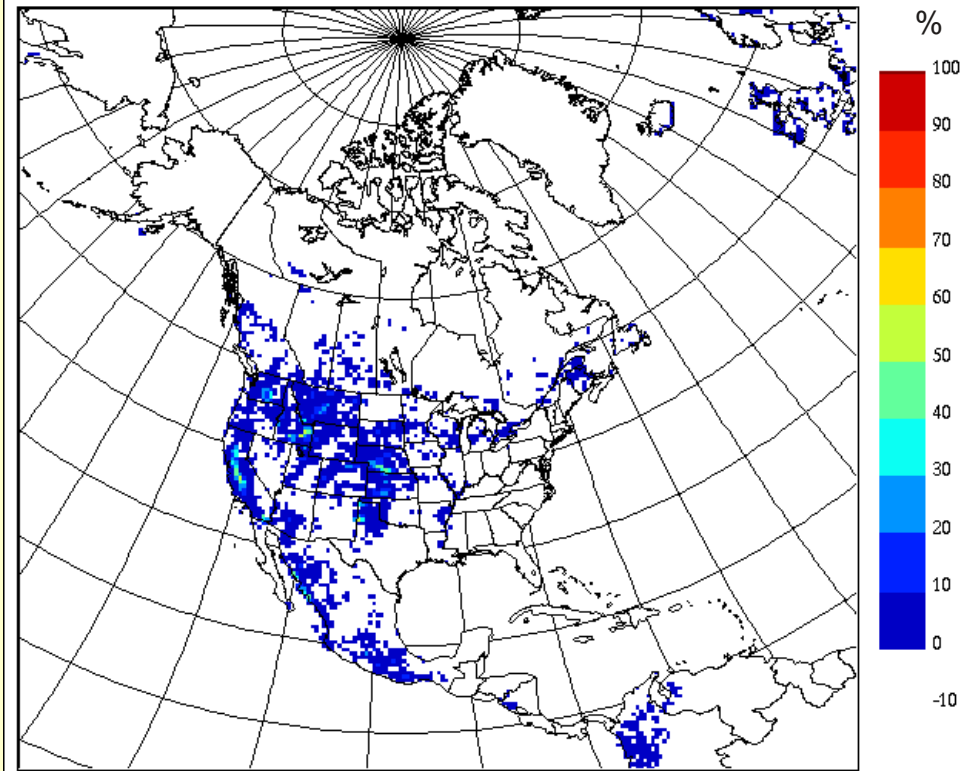

Crops

crops

irrigated crops

Crops

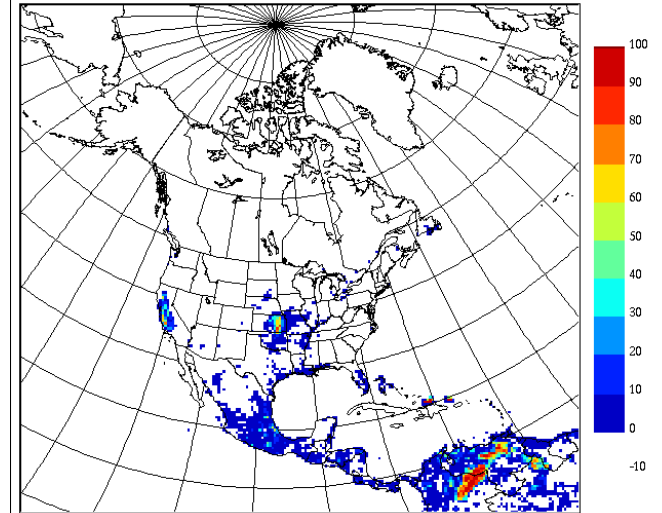

evergreen broadleaf shrub

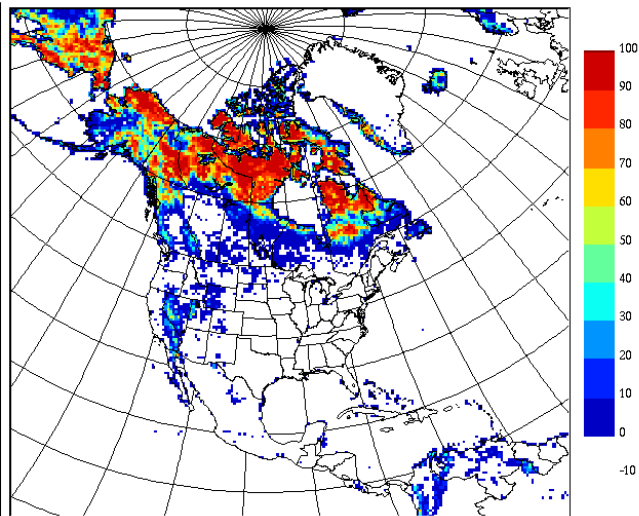

short grass and forbs

long grass

tundra

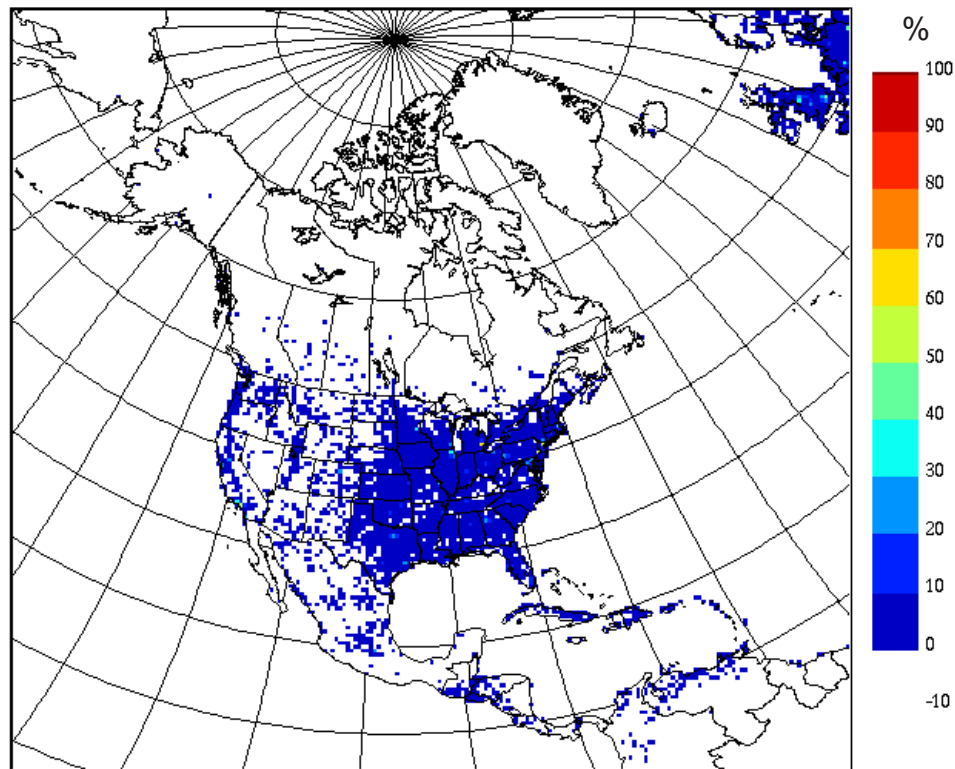

swamp

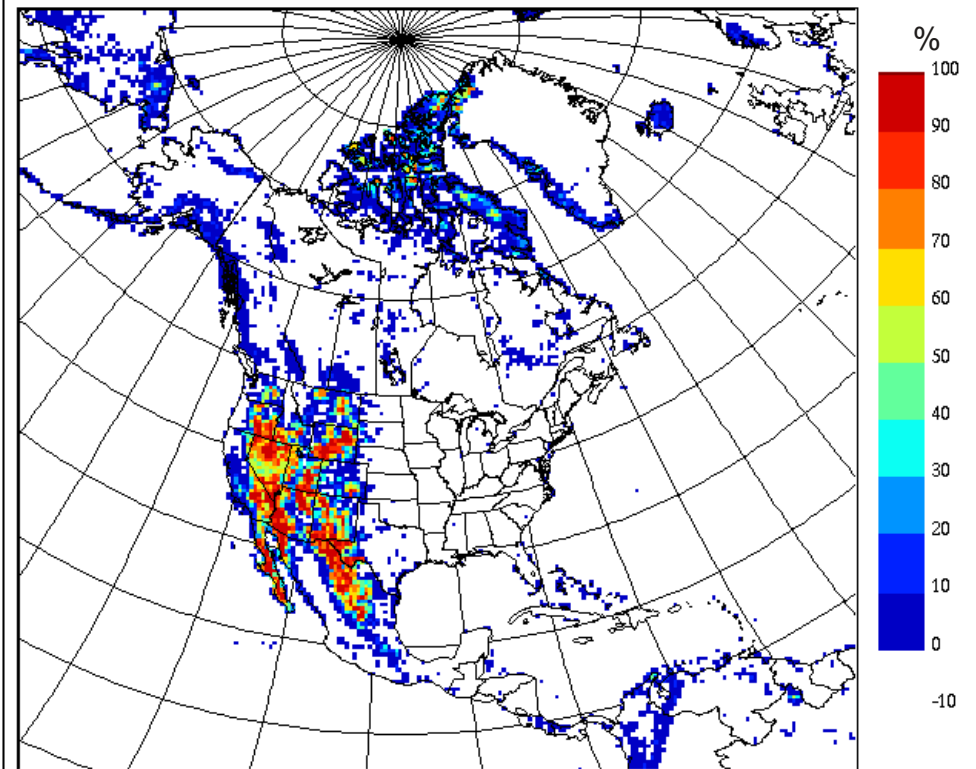

mixed shrubs

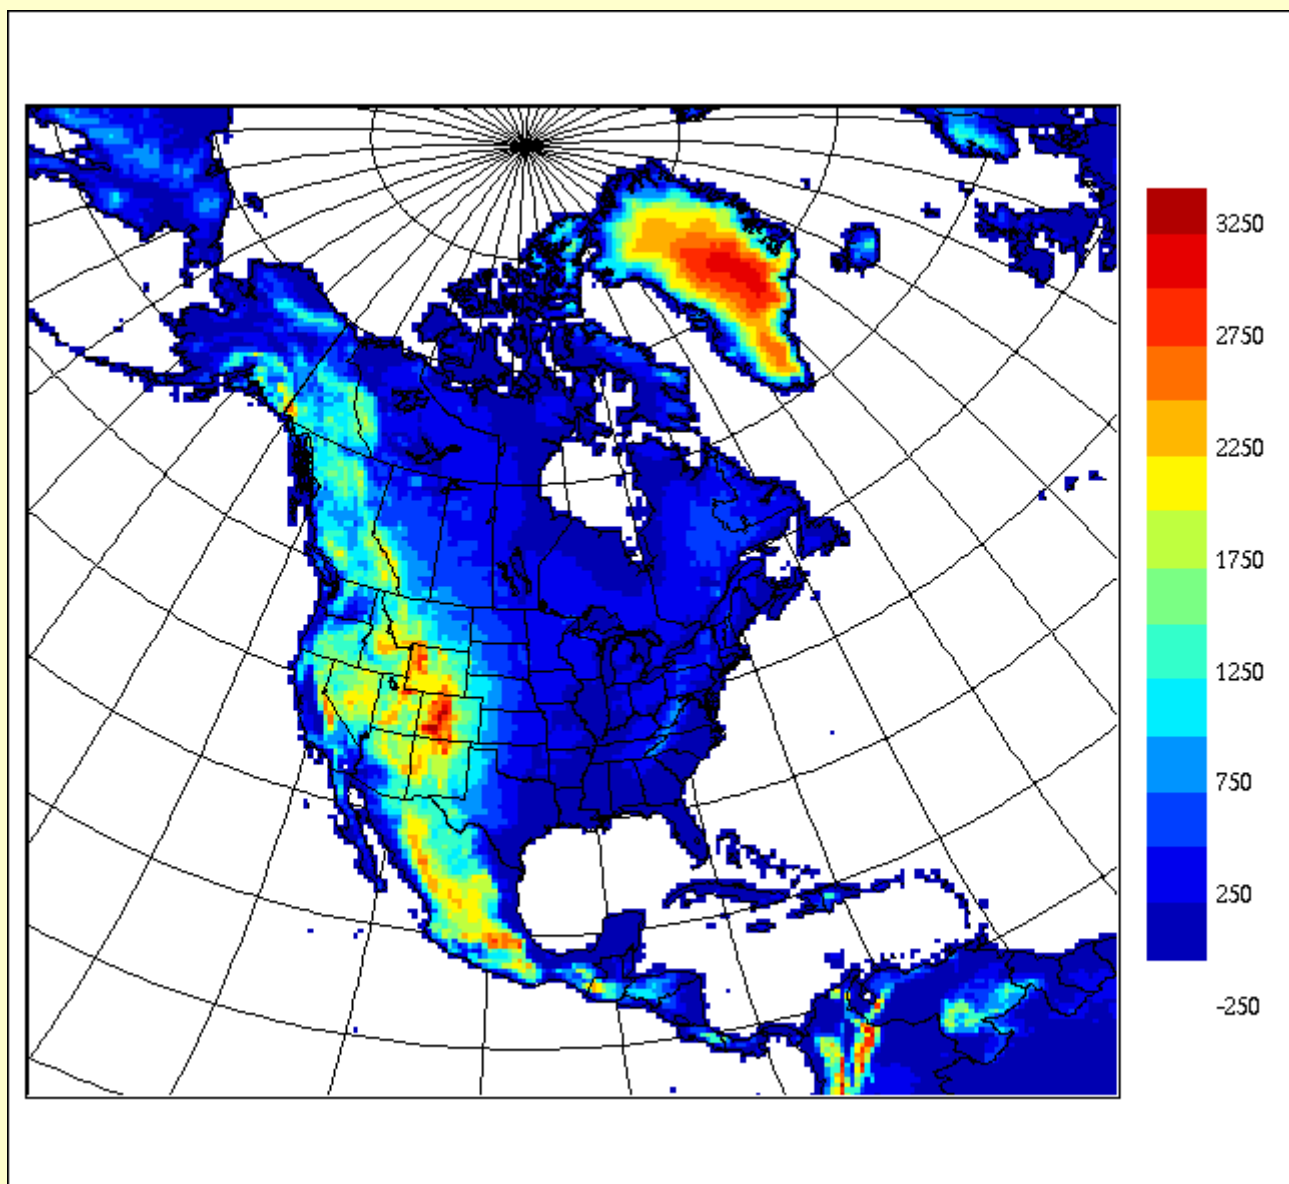

urban

bare soil / desert

Mountain height

Pole problem

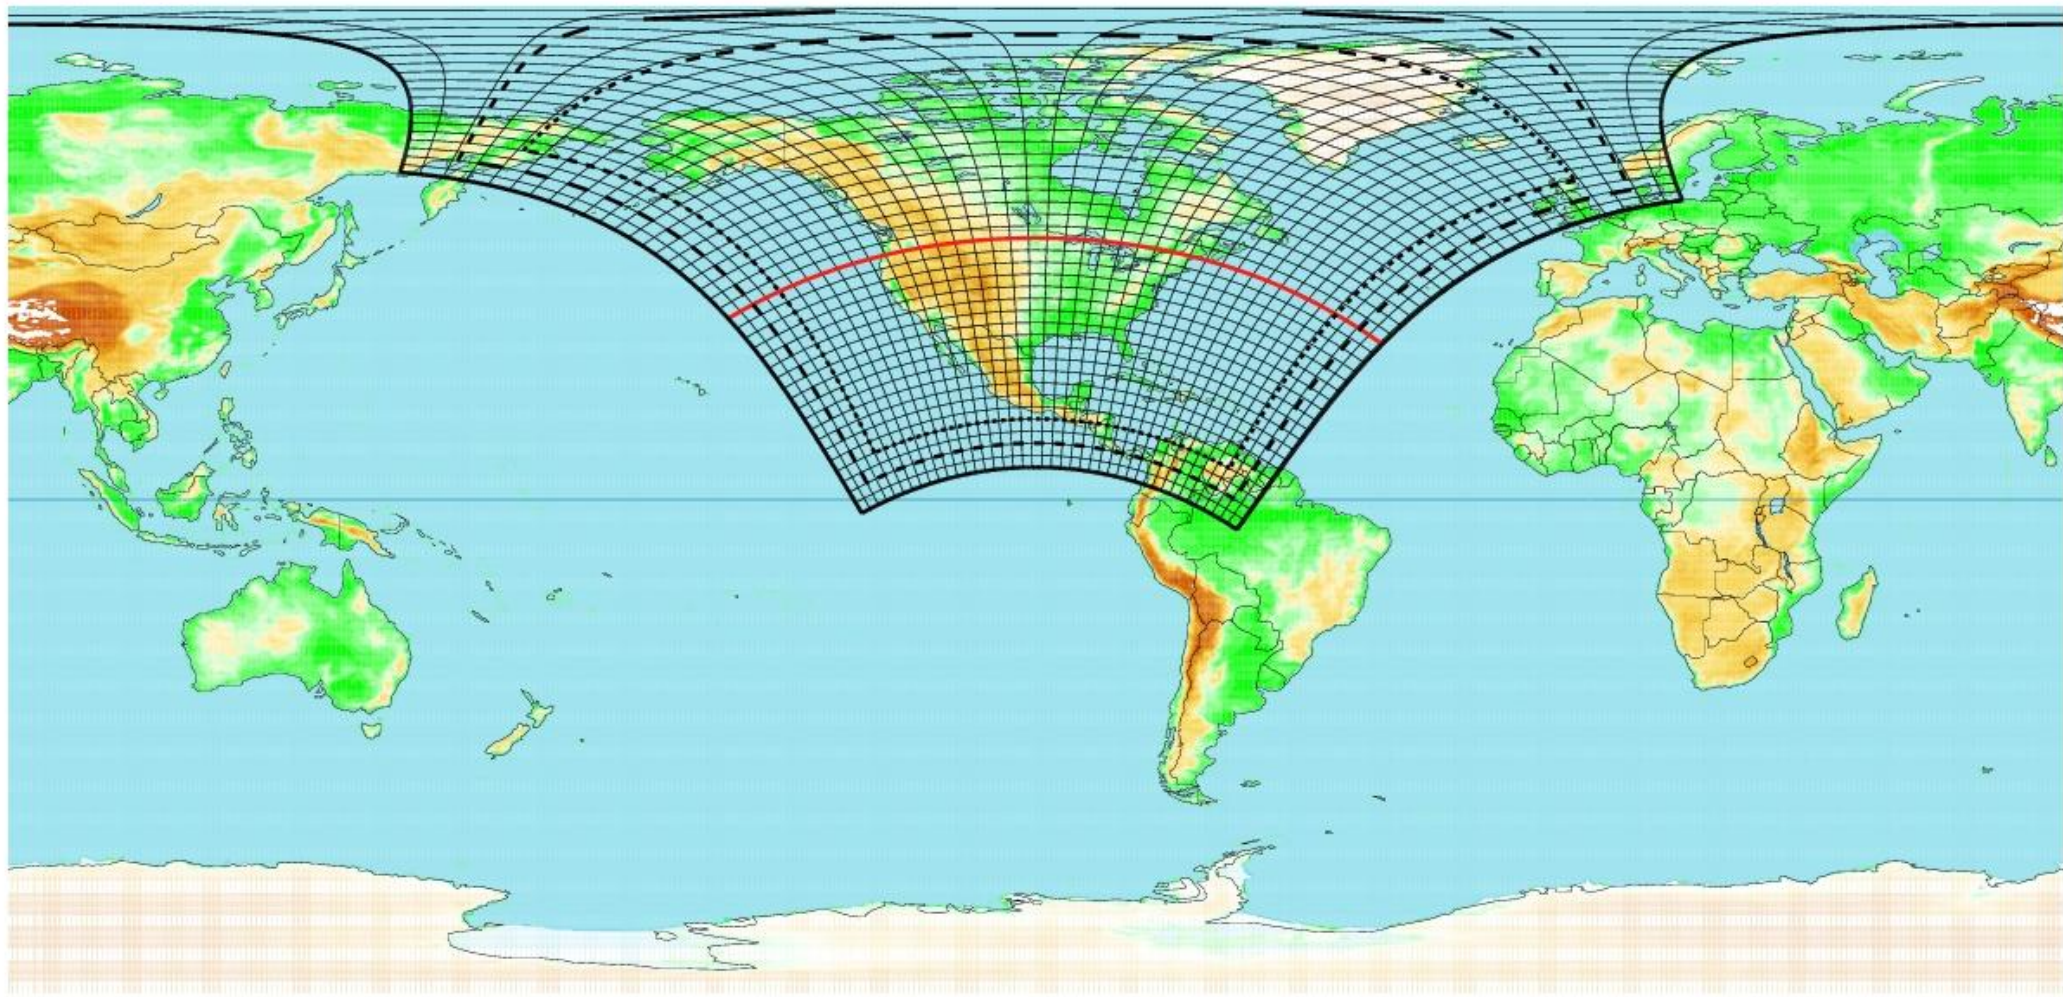

2-D cloud fraction

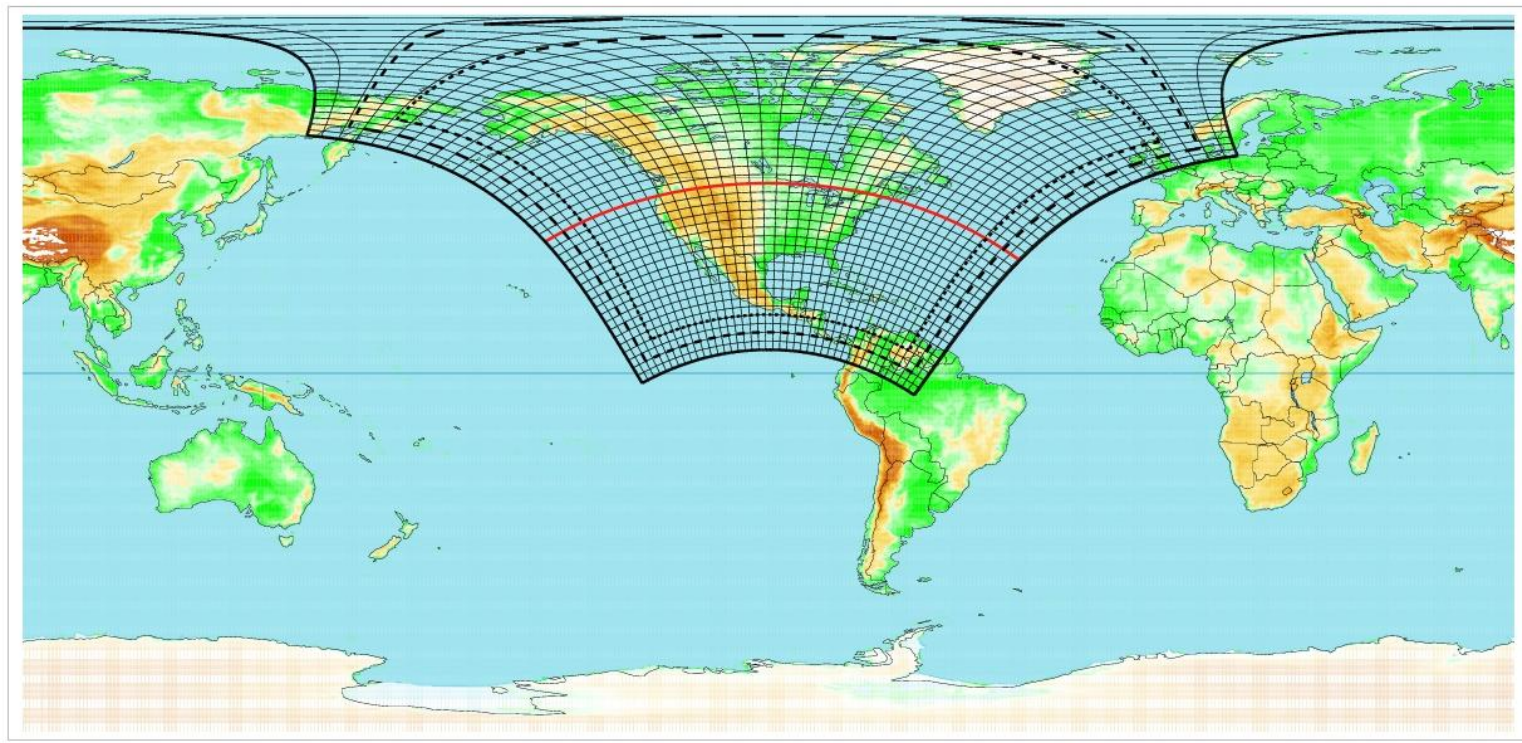

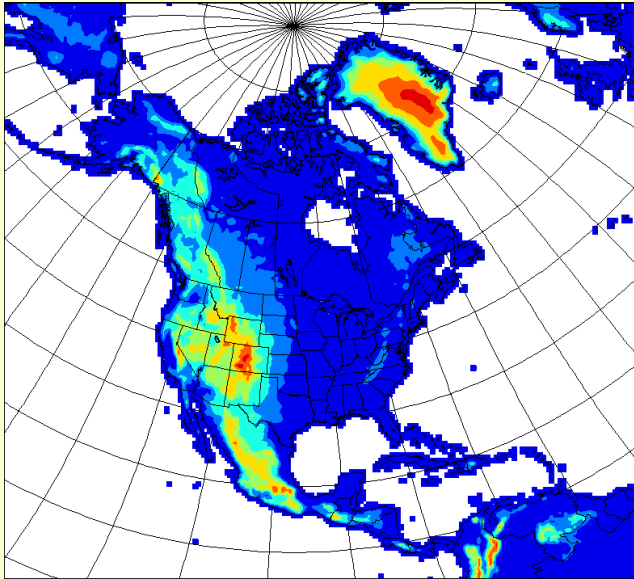

Rotated grid

Rotated grid

Rotated grid

Yin-Yang grid (GEM 4)

Qaddouri, A., and V.Lee, 2011

M. Kameyama et al. 2008

Model level types

model grid for dynamics

model grid for physics (core + 3)

core area

free area (usually output grid)

pilot region / halo

blending / merging area

(both usually
10 points wide)

**Different
“zones”**

Parallelization

of CRCM5,

a grid point model

(there are also global “spectral” models)

MPI

"Message Passing Interface"
distributed memory

Partitioning of the domain into tiles

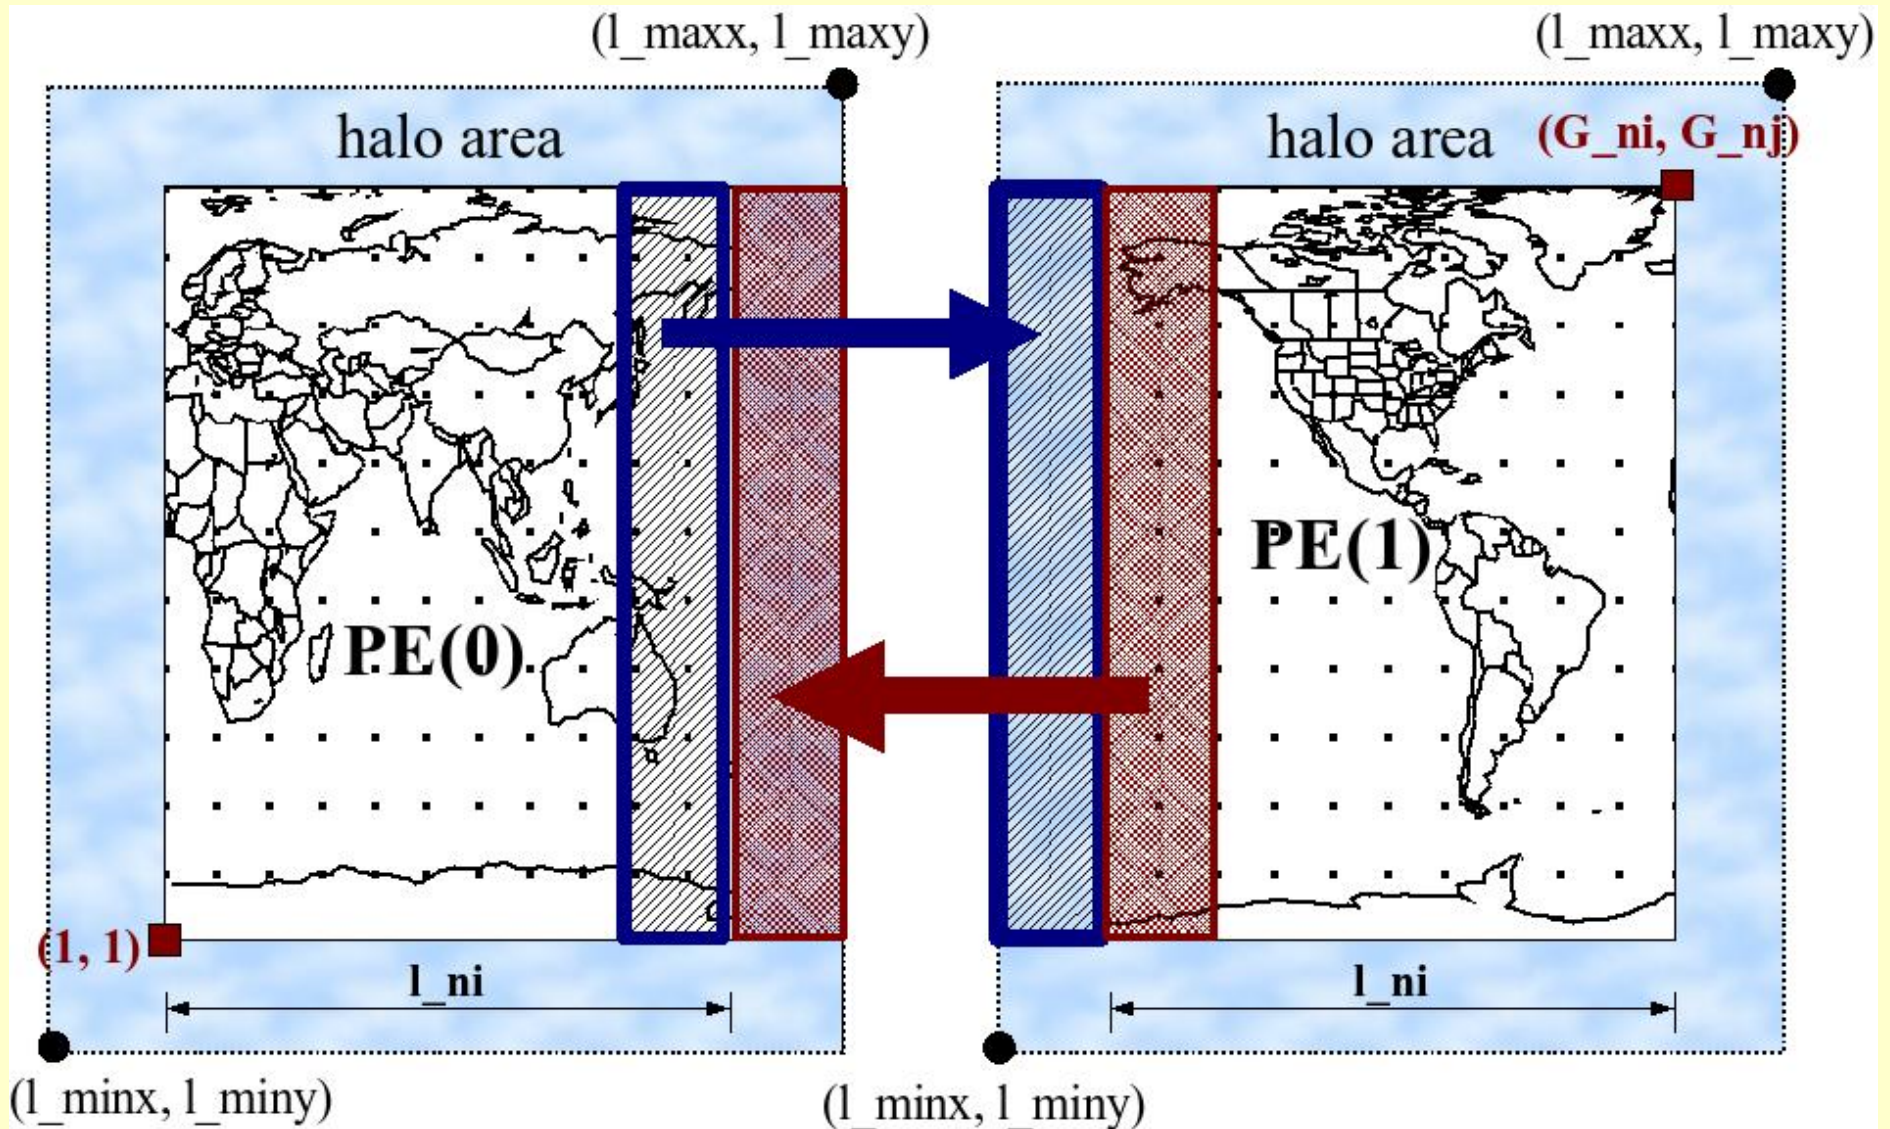

Each cpu will execute the model on one tile.

LAM grid partitioned into 4x4 tiles:

MPI

"Message Passing Interface"
distributed memory

Courtesy of Vivian Lee

OpenMP

using **shared memory**

OpenMP in the physics:

The physics get called one **slab** at the time

Model **input**

- 3 **config files** (simulation, input and output configurations)
- **Geophysical fields**
(land/sea mask, orography, vegetation type and fraction soil types, etc.)
- **Analysis or initial condition file**
Fields needed to initialize soil and atmospheric variables
- **Lateral BC's** / Driving data / Pilot files (**LAM** mode only!!!)
 - temperature**,
 - u-wind**,
 - v-wind**,
 - humidity** (relative, specific or dew point temperature),
 - geopotential** (if data are on pressure levels),
 - clouds** (if available)
- **Lower BC's** (**SST** & **sea ice**)
- Atmospheric **ozone** (AMIP2, 2-D climatology: 61 latitudes and 59 levels)
- **Deep soil temperature**
- Global average yearly **greenhouse gas concentrations** (i.e. RCP_4.5, RCP_8.5)

Driving data

- Analysis
GEM,
ECMWF
- Reanalysis
ERA40 / ERA-Interim (ECMWF),
JRA25 (Japan),
NCAR (USA),
...
- Model output (GCM / LAM)
CRCM5,
CanESM2 (CCCma, Canada),
MPI-ESM-LR/MR (MPI, Germany),
HadGEM2-ES (Hadley Centre, UK),
...

CRCM5 is divided into two parts:

Dynamics

- grid setup
- parallelism (MPI and OpenMP)
- memory allocations
- advection
- horizontal diffusion
- lateral boundary conditions (LAM)
-
-

Physics

- radiation
- convection
- condensation
- land surface schemes (CLASS, ISBA, ...),
ocean, lakes, glaciers, sea ice
- boundary layer vertical diffusion
- specified surface forcings
(when no ocean model)
-

Model output

- usually we output on the “free” grid
- Output files are divided into files with **dynamics** resp. **physics** fields (first character) on **model** resp. **pressure** levels (second character)

Example:

dm... : **d**ynamics on **m**odel levels
dp... : **d**ynamics on **p**ressure levels
pm... : **p**hysics on **m**odel levels
pp... : **p**hysics on **p**ressure levels

Archiving

In the **archive directory of each simulation** you find some (or all) of the following subdirectories:

Samples: Original 2-/3-D model output;
one subdirectory per month containing
dm-, dp-, pm-, pp-files with
1 or more time steps per file (usually 1 file per month)

Diagnostics: Monthly means and variances
one subdirectory per month containing
dm-, dp-, pm-, pp-files for
mean (moyenne) and variance

Timeseries: Station time series

Pilots: Monthly pilot files

Analysis: Analysis initial condition files step (usually 1 per month)

Restarts: Restart files

Listings: Listings from all machines

Jobs: At runtime created jobs/scripts

Listings: Listings from all machines

Dynamic fields...

3-hourly output

... at the surface (dm-files)

TT : 2m temperature [°C]
UU : 10m u-wind component (east-west direction) [**knots**]
VV : 10m v-wind component (north-south direction) [**knots**]
UV : 10m wind modulus [**knots**]
HU : 2m specific humidity [kg/kg]
HR : 2m relative humidity [0-1]
P0 : surface pressure [hPa]
PN : sea level pressure [hPa]

... on pressure levels (dp-files)

TT : air temperature [°C]
UU : u-wind component (east-west direction) [knots]
VV : v-wind component (north-south direction) [knots]
WW: vertical momentum [Pa/s]
HU : specific humidity [kg/kg]
GZ : geopotential [dam]

Physic fields

3-hourly output

- **precipitation** (total; liquid/solid; convective/large scale) (**hourly total precipitation**)
 - **runoff** (total; surface; drainage)
 - **radiation** (long/short wave; model top/surface; up/down/net)
 - **clouds** (2-D; liquid/ice water path; int. water vapour)
 - **snow** (depth; density; albedo; temperature; SWE; water in snow pack)
 - **albedo**; **glacier temperature** (constant glacier fraction)
 - **skin temperature & humidity**
 - **soil** (temperature; liquid & ice water content)
 - **SST** (BC); **sea ice** (fraction (BC); temperature; thickness)
 - **lake fields**
-
- **daily 2m minimum & maximum temperature**
 - **10m maximum wind**
